

# Rentalfront Remote

## Reservations anywhere

Rentalfront Remote presents a possibility to put a car reservations engine on **any** website. This booking engine is rendered dynamically on the page by Javascript. The entire booking process will be seamlessly integrated into the website. This means that the end user will stay on the same website until the booking is completed.

## Rentalfront

Rentalfront Remote is an extension to Fareoffice's powerful Rentalfront platform. By utilizing this already built platform, Rentalfront Remote can retrieve rates, reservations and location information from several different brands at the same time.

The Rentalfront XML product provides access to this functionality for partners that want to build their own booking engine. With Rentalfront Remote, partners without the possibility to build their own solutions can still benefit from the same content, still integrated into their own website.

## How it works

A partner will receive a short snippet of HTML code to put on their site. When this is done and a user loads the webpage, the booking engine will be rendered dynamically on the page. When the user is going through the booking process, all communication with Rentalfront will be done in the background. The user remains on the partner website throughout the whole process.

The partner may ask for a custom layout for their booking engine, and they can override the CSS if they like to use their own colors, fonts etc.

## Feature highlight

- Very easy to integrate for partners
- All steps of the booking process
- Highly customizable
- Can be set up on virtually any website
